Pro Output

Thank you for purchasing the WMD **Pro Output.**

The **Pro Output** is a high fidelity module, intended to get your modular interfaced with professional and consumer level gear. It also provides a very high quality headphone amplifier.

Inputs are stereo. If just the left is used, it is normaled to the right channel.

Nominal input amplitude is 10Vpp. 10Vpp input will give unity level on each output. Most eurorack modules are limited to 20Vpp at their output. The headroom available on the **Pro Output** is 23Vpp. This eliminates the possibility of distortion anywhere in the **Pro Output.**

The Stereo (-10dbV) output is intended to drive consumer level equipment directly. It can also drive a second set of headphones.

The +4dBu outputs can drive balanced and unbalanced loads. They are capable of very long cable runs and are ideal for use on stage or in the studio.

Pro Output Specs: 6HP wide, +60mA/-60mA current draws. 39mm deep.

Jumpers on the rear increase the maximum available level for headphones. Connect the jumpers as shown on the right to increase the available output drive. **Loudness Warning: The headphone driver can be VERY LOUD and can result in hearing damage.**
