# QUAD ATTEN

QUAD ATTEN is a passive quad attenuator in a small 4hp profile. Although quite basic, attenuators are extremely powerful in a modular system. They are especially useful for adjusting the depth of control voltages going into modules that lack CV attenuators.

## ATTENUATORS

These are the attenuator controls for each of the respective inputs. They work like volume controls for audio and control voltages (CV).
At minimum setting, the applied signal will be off.
At maximum setting the signal will pass at unity gain.
The attenuators are marked by number on the upper right to denote the associated input and output.
